Implementing Custom RandomSearchCV

```
def RandomSearchCV(x_train,y_train,classifier, param_range, folds):
    # x_train: its numpy array of shape, (n,d)
    # y_train: its numpy array of shape, (n,) or (n,1)
    # classifier: its typically KNeighborsClassifier()
    # param_range: its a tuple like (a,b) a < b
    # folds: an integer, represents number of folds we need to devide the data and test our model

    #1.generate 10 unique values(uniform random distribution) in the given range "param_range" and store them as "params"
    # ex: if param_range = (1, 50), we need to generate 10 random numbers in range 1 to 50
    #2.devide numbers ranging from 0 to len(X_train) into groups= folds
    # ex: folds=3, and len(x_train)=100, we can devide numbers from 0 to 100 into 3 groups
    group 1: 0-33, group 2:34-66, group 3: 67-100
    #3.for each hyperparameter that we generated in step 1:
    # and using the above groups we have created in step 2 you will do cross-validation as follows

    # first we will keep group 1+group 2 i.e. 0-66 as train data and group 3: 67-100 as test data, and find train and test accuracies

    # second we will keep group 1+group 3 i.e. 0-33, 67-100 as train data and group 2: 34-66 as test data, and find train and test accuracies

    # third we will keep group 2+group 3 i.e. 34-100 as train data and group 1: 0-33 as test data, and find train and test accuracies
    # based on the 'folds' value we will do the same procedure

    # find the mean of train accuracies of above 3 steps and store in a list "train_scores"
    # find the mean of test accuracies of above 3 steps and store in a list "test_scores"
    #4. return both "train_scores" and "test_scores"

    #5. call function RandomSearchCV(x_train,y_train,classifier, param_range, folds) and store the returned values into "train_score", and "cv_scores"
    #6. plot hyper-parameter vs accuracy plot as shown in reference notebook and choose the best hyperparameter
    #7. plot the decision boundaries for the model initialized with the best hyperparameter, as shown in the last cell of reference notebook
```
